

Case Study

Industry: Technology, Media & Communications – Data Centre & Infrastructure Services

Oracle Cloud ERP Backbone for a Pan-European Data Centre Operator

Overview

A fast-growing data centre and infrastructure services provider operating across key European markets. As demand for secure, scalable digital infrastructure increased, the organisation focused on preparing its internal platforms to support continued expansion.

Challenge

Finance operations were supported by multiple local systems across countries, limiting consolidated reporting, financial control and governance. Existing platforms also struggled to support subscription- and consumption-based revenue models aligned with data centre usage and services.

Solution

Hitachi Digital Services implemented Oracle Cloud ERP as a unified financial backbone across the UK, Germany and France. The programme covered Oracle Financials, reporting and subscription management, enabling standardised processes, stronger controls, improved compliance, and accurate tracking of usage-based consumption revenue.

Value delivered

The programme delivered consistent financial operations across EMEA, improved insight and reporting at group level, and strengthened financial controls and compliance. The new ERP backbone provides a robust platform to support future growth and evolving service models.
